A General Note: Piecewise Functions. A piecewise function is a function in which more than one formula is used to define the output. Each formula has its own domain, and the domain of the function is the union of all these smaller domains.

Functions assign outputs to inputs. Some functions have simple rules, like "for every x , return x^2 ." However, there can be other rules that are more elaborate. For example, "If $x < 0$, return $2x$, and if $x \geq 0$, return $3x$." These are called *piecewise functions*, because their rules aren't uniform, but consist of multiple pieces. A piecewise function is a function built from pieces of different ...

The following is an example of a piecewise function: With this function, you use one rule for all numbers smaller than or equal to -2 , another rule for numbers between -2 and 3 (including the 3), and a final rule for numbers larger than 3 . You still have only one output value for every input value.

Graph a Piecewise Function - dummies

Example 3 the function f could have been written as $f(x) = x + 1, 0 \leq x < 4$. Writing a Piecewise Function Write equations for the piecewise function whose graph is shown. SOLUTION To the left of $x = 0$, the graph is part of the line passing through $(-2, 0)$ and $(0, 2)$. An equation of this line is given by: $y = x + 2$

Figure $\{\text{PageIndex}\{16\}\}$: Cubic function $\{f(x) = x^3\}$. For the cubic function $\{f(x) = x^3\}$, the domain is all real numbers because the horizontal extent of the graph is the whole real number line. The same applies to the vertical extent of the graph, so the domain and range include all real numbers.
