Chapter 23 – The Evolution of Populations 1. Microevolution – evolution on its smallest scale, as change in allele frequencies in a population over generations 2. Causes of allele frequency change: natural selection, genetic drift, gene flow • Genetic drift – chance events that alter allele frequencies • Gene flow – transfer of alleles between populations I. Genetic variation makes evolution possible 1.

Evolution is the gradual change of genotype and phenotype of organisms over time in response to selection pressures. This enables organisms to become better equipped to exploit their environment. Random processes are governed by the laws of probability and cannot be forecast except for a certain degree of directionality.
