Distributed operating System - Tutorialspoint

A distributed system contains multiple nodes that are physically separate but linked together using the network. All the nodes in this system communicate with each other and handle processes in tandem. Each of these nodes contains a small part of the distributed operating system software. A diagram to better explain the distributed system is –

Multicomputer- the distributed Operating system uses a separate uniprocessor OS on each computer for communicating between different computers. In distributed OS, a common set of services is shared among multiple processors in such a way that they are meant to execute a distributed application effectively and also provide services to separate independent computers connected in a network as shown in fig below

Broad and up-to-date coverage of the principles and practice in the fast moving area of Distributed Systems. Distributed Systems provides students of computer science and engineering with the skills they will need to design and maintain software for distributed applications. It will also be invaluable to software engineers and systems designers wishing to understand new and future developments in the field.

Distributed Systems: Concepts and Design, 5th Edition

All distributed systems consist of multiple CPUs. There are several different ways the hardware can be arranged. The important thing related to hardware is that how they are interconnected and how they communicate with each other.

A distributed operating system is a software over a collection of independent, networked, communicating, and physically separate computational nodes. They handle jobs which are serviced by multiple CPUs. Each individual node holds a specific software subset of the global aggregate operating system.

Distributed operating system - Wikipedia

A distributed operating system contains multiple computers. These devices communicate with each other via a shared network. Each device is independent and consists of its own memory and CPU. The data processing task is distributed among the devices.
