An explanation of longshore drift and how it is affecting one farm in Holderness on the east coast of England. A group of children conduct an experiment to see how longshore drift works.

Coastlines - longshore drift - KS1 Geography - BBC Bitesize

Dr Daniel Harris, a lecturer in geography at the University of Queensland, said longshore drift was the transport of sediment along the coast due to waves. Prevailing winds push the sand up the New South Wales and Queensland coast. (ABC Weather: Kate Doyle) "It occurs when the dominant waves arrive at an angle to the coast.

What makes Queensland beaches so beautiful? NSW dirt — and ...

Longshore drift is a process of transportation that shifts eroded material along the coastline. Waves approach the coast at an angle. Swash carries sediment up the beach at an angle. Backwash...

Landforms created by deposition - Coastal landforms - BBC

The transport of sand and pebbles along the coast is called longshore drift. The prevailing wind (the direction the wind usually blows from) causes waves to approach the coast at an angle. The swash carries the sand and pebbles up the beach at the same angle (usually 45°).

Longshore Drift - Geography Revision

The movement of the material is known as longshore drift. Waves approach the coast at an angle because of the direction of prevailing wind. The swash will carry the material towards the beach at an...

Transportation - Coastal processes - BBC Bitesize

Longshore drift is a geological process responsible for transporting sediments such as shingle, silt, clay, and sand along a coast that is aligned to the shoreline, relying on prevailing oblique winds. The prevailing oblique winds send water down the coast generating a water current which in turn advances parallel to the coast.

What is Longshore Drift? - WorldAtlas

Longshore drift is simply the sediment moved by the longshore current. This current and sediment movement occur within the surf zone. Beach sand is also moved on such oblique wind days, due to the swash and backwash of water on the beach.

Longshore Drift | Teaching Resources

Longshore drift is the process of the ocean currents forcing sand and other material down a beach. The material is first pulled into the currents by the backwash (the water going out to sea) and is then pushed back up the beach by the swash (the water going onto the beach). Longshore drift always moves in the direction of the main wind.

Longshore drift Facts for Kids

Longshore Drift is an attempt to capture a glimpse of what we are losing. Longshore Drift was written for radio and first broadcast on BBC Radio 3. Jardine Press Ltd 2005 ISBN 0-9539472-9-7
